

U1L3 – Mastery Check

Score: / 5

Unit 1 Lesson 3: Exploring Data Types

Feedback:

Review + Retest

| Next Lesson

Name: _____

1. Identify the data types. Write **string**, **integer**, **float**, or **boolean** for each value.

a. "Chicago" → _____

f. 18.0 → _____

b. 42 → _____

g. -7 → _____

c. 3.14 → _____

h. "7" → _____

d. False → _____

i. True → _____

e. "True" → _____

j. 0 → _____

2. Fix the error. Why does this cause an error, and how do you fix it?

```
print("Height: " + 1.75)
```

Error explanation: _____

Corrected version: _____

3. Predict the output. What does Python print?

```
print(type("7"))
```

Output: _____

4. Boolean thinking: Circle **all** the valid Boolean **values** in Python:

True true False "False" FALSE

5. Debug the code. There is **one** mistake. Rewrite the corrected line.

```
is_ready = "True"
```

Corrected version: _____

6. Type Conversion: Write the **correct Python code** to convert the string "29" into an integer and print its type.

Your code:

```
-----  
-----
```

3. Predict the output. What does Python print?

```
print(type("7"))
```

Output: _____
