Student Project Workbook:

Climate Action App Design

Project Type: UX Design Thinking **Mode:** Individual

Core Skills: Research, Analysis, Wireframing, Iteration, Communication

Your Google Drive Folder: [LINK](#)

1. Project Overview

Project Overview Sheet

Sections:

1.  Introduction
2.  What You'll Do
3.  [How You'll Be Graded](#)
4.  [Project Schedule](#)
5.  [Resource Hub](#)

Introduction

Every great app starts with a problem—and a person who cares enough to try solving it.

In this project, you'll take on the role of a designer trying to make a positive impact on the planet. Using **design thinking**, you'll explore an environmental issue that matters to you, learn about what people need, and create a mockup of a digital tool that could help.

Your app doesn't need to be fully built or coded. Instead, you'll focus on **understanding real needs, testing your ideas, and communicating your vision clearly**. Along the way, you'll learn how to analyze other tools, gather peer feedback, and make meaningful design choices.

You'll work through this project in **stages**, with built-in reflection and support. You'll have options for how to wireframe (by hand, in Slides, or using free tools like Wireframe.cc), and you'll present your work in a final slide deck. This is an independent project that will include some peer collaboration.

This is your chance to apply what you've learn in a creative, practical way—to show how thoughtful design can be used for climate action, education, and justice.

What You'll Do

In this project, you will:

- **Choose a climate-related issue** that matters to you or your community
- **Research the issue** and compare existing apps/tools
- **Define your own idea** and write a 30-second pitch
- **Create a wireframe or sketch** for your app (paper, digital, or online tools)
- **Get peer feedback** and improve your design
- **Build a slide deck** that explains your idea, process, and learning
- **Present your work** to the class

You can work individually or in a small group. Either way, you'll be responsible for your own reflections and learning.

Create a folder in your Google Drive called:
"[First Last] Climate App Project"

Then copy the link to that folder and link it to the cover sheet where it says "**LINK**" (*highlighted area*)

Make sure the sharing settings are set to "Anyone with the link can view" so your teacher can access all your work in one place.

How You'll Be Graded

How You'll Be Graded

Your grade will come from the **artifacts you create**, such as research notes, sketches, and final designs. These show your thinking and creativity. To do them well, you'll need to engage with each phase of the project.

Each graded category has a required product, and you'll need to complete it thoughtfully to earn full points. Your ideas don't have to be perfect, but they should be clear, well-supported, and intentionally designed.

Part 1: Design Thinking Artifacts – 120 points total

Category	Points	What You'll Turn In
Comparative App Analysis	20	A chart or notes comparing 3–5 existing apps
Research Synthesis	20	Summary of findings and user needs you identified
Initial Wireframes or Sketches	20	Layout of 2–5 key screens for each of your three core tasks
Design Studio Participation	10	Shared your idea + created sketches for a peer
Elevator Pitch (30-sec)	10	A concise summary of your app's purpose and value
Peer Critique + Iteration Notes	20	Feedback you received + what changes you made
Final Screens (Higher Fidelity)	20	More polished wireframes or mockups of your app

Part 2: Final Reflection – 10 points

Thoughtful, complete responses in Tab 12 that reflect on your design process, learning, and growth.

Part 3: Final Presentation – 10 points

A short slide deck and final presentation to explain your app, design choices, and how your idea evolved. Should include visuals and a clear balance of text and images.

Total: 140 points

Project Schedule

Project Schedule

● Week 1 – Define the Problem + Pitch Your Idea

Goal: Understand your topic, define your user, analyze similar apps, and plan your solution.

By the end of Week 1, you should have:

- ☒ Chosen a climate/environmental focus
- ☒ Identified a target user
- ☒ Completed app comparison matrix (3+ apps)
- ☒ Summarized user needs and research
- ☒ Outlined core features your app will include
- ☒ Written a draft 30-second elevator pitch

Suggested Deadline: Friday of Week 1 – All research + 30-second pitch should be complete and ready for design studio.

● Week 2 – Sketch, Test, and Begin Digitizing

Goal: Create wireframes, test your concept, and begin translating to digital format.

By the end of Week 2, you should have:

- ☒ Sketched your initial app wireframes (2–3 screens minimum)
- ☒ Participated in a design studio and peer sketch exchange
- ☒ Identified 3–5 core tasks your user needs to complete
- ☒ Conducted a paper usability test with a peer and gathered feedback
- ☒ Revised your wireframes based on peer input
- ☒ Begun digitizing at least 2 key screens

Suggested Deadline: Friday of Week 2 – Wireframes revised and at least 2 screens digitized.

● Week 3 – Iterate + Finalize Screens

Goal: Improve your design and prepare your final visuals.

By the end of Week 3, you should have:

- ☒ Completed peer feedback round 2
- ☒ Edited and polished your full set of wireframes or mockups
- ☒ Finalized 3–5 high-quality screens showing core functionality
- ☒ Started organizing your slide deck content

Suggested Deadline: Friday of Week 3 – All app screens finalized and ready for presentation build-out.

● Week 4 – Final Presentation + Reflection

Goal: Present your work and reflect on your process.

By the end of Week 4, you should have:

- ☒ Completed your final slide deck (using template or custom)
- ☒ Delivered your class presentation
- ☒ Submitted your final project (link to screens + slides)
- ☒ Completed your final reflection

Suggested Deadline: End of Week 4 – Final materials turned in and reflection submitted.

Resource Hub

Resource Hub

Helpful tools:

- [Wireframe.cc](https://wireframe.cc) – Simple wireframing (no login)
- [Excalidraw](https://excalidraw.com) – Visual sketching/mockups (no login)
- [Canva](https://canva.com) – For layouts and mockups; also for slideshows
- [Slidesgo](https://slidesgo.com) – For slideshow templates

Templates:

- [Pitch Deck Overview](#) – What should you include in your final presentation?
- [App Comparison Worksheet](#) – Linked in Tab 3

Videos:

- [Understanding Users for Better UX](#)
- [Creating a wireframe using wireframe.cc](#)
- [How to Create Your First Wireframe \(A UX Tutorial\)](#)
- [Tips on Sketching Your Wireframes](#)
- [How to create BASIC SHAPES in Excalidraw | Tutorial 1](#)

Things to Search:

- “UI icons”-- find small icons to use in your wireframes
- “UI elements”-- see examples of different buttons, drop downs, and other parts of a screen to
- “Good mobile UI”-- see examples of good screen layouts for phones

Submission Reminders

- 📁 Create your **Google Drive Folder**: “[First Last] Climate App Project”
- 💡 Paste the folder link on the cover page (where it says **LINK**)
- ✅ Make sure your folder is viewable (Anyone with the link can view)

2. Intro to Design Thinking

Tab 2: Intro to Design Thinking

Short Reading

Purpose: Understand how the design thinking process helps you create an app that truly meets user needs.

Watch: What is Design Thinking?

Start by watching this quick video:

 [Design Thinking in 60 Seconds](#)

What Is Design Thinking?

Design thinking is a **creative way to solve problems** by focusing on the people who are affected. It helps you build something that's actually useful and easy to understand—not just what you *think* might work.

It has **five key steps**, and you'll use each of them in this project:

Stage	What It Means
Empathize	Learn about the people you're designing for. What do they need? What challenges do they face?
Define	Get clear about the problem you're trying to solve. Focus on the root issue, not just symptoms.
Ideate	Brainstorm as many ideas as possible. Don't edit yourself—think big and wide.
Prototype	Build a simple version of your idea to test it. Sketch it, wireframe it, or mock it up.
Test (& Iterate)	Get feedback, improve your idea, and repeat. Great design takes multiple tries!

You won't move through these in a perfect order. Sometimes you'll loop back to earlier steps after learning something new—and that's the point.

What Is UX Design?

UX stands for **User Experience**.

UX design is about making things easy, helpful, and enjoyable for real people to use, especially when it comes to **apps, websites, or digital tools**. A UX designer thinks like the user and asks:

- Is this easy to navigate?
- Does it solve the right problem?
- Can I use it without getting confused?

In this project, **you are the UX designer**. You'll be using design thinking to build an app that works well, feels clear, and helps your user do what they need to do.

 UX design and design thinking go hand-in-hand. UX is the goal—design thinking is the process that helps you get there.

How This Connects to Your Project

As you work through your app design project, each activity is part of this design process. You'll:

- **Empathize** by researching your users and climate issue
- **Define** the problem you want to solve
- **Ideate** through sketching, brainstorming, and peer collaboration
- **Prototype** your solution using wireframes and mockups
- **Test & Iterate** by getting feedback and refining your design

We'll show you which step you're working on in each tab to help you think like a designer.

3. ➡ 📱 App Comparison + Feature Analysis

Tab 3: ➡️📱 App Comparison Sheet: How to Get Inspired by What Already Exists

Independent Activity

[Make a copy of this spreadsheet](#)

Link your copy here for easy access: **LINK**

Note: You will submit this *in Google Classroom* when you are ready to turn it in.

👁️ What This Is:

This is a tool to help you explore **real apps or tools** that already try to help people — either with your **topic** or with a **similar type of purpose** (like teaching, tracking, or connecting people).

You'll look at:

- What the app does
- Who it helps
- What works well
- What could be improved
- What ideas or features you might want to use in your own app

🤔 Why This Matters:

You've already chosen your topic and user in your **Pre-Work Worksheet**.

Now it's time to:

- Get inspired by what already exists
- Learn from good (and not-so-good) design
- Think critically about what your app will do differently or better

This will **prepare you for your Research Synthesis** in Tab 4, where you'll define your own app's direction.

↩️ What If You Can't Find Apps About Your Exact Topic?

That's totally fine! Instead, look for apps that do the same *type of thing* your app will do.

If your app will...

- 🧠 Teach people something → Look at learning games, quiz apps, or tutorial apps
- 📍 Connect people to resources → Look at map apps, directories, or help centers
- ✅ Track habits or progress → Try fitness apps, water trackers, or sustainability logs
- 👤 Motivate action → Check out challenge apps or goal-setting platforms

Your job is to learn **what makes an app helpful and easy to use**—even if it's not about your exact topic.

What You'll Do:

1. Find 3-5 apps or websites

- Some should match your topic
- Some can match your app's purpose or style

2. Fill out the comparison spreadsheet:

- Add links, features, who it's for, pros/cons, and takeaways
- Reflect on how the apps work and what ideas they give you
- If you are investigating apps that you have never used, you might want to find video tutorials or explanations of them online. You are **NOT** expected to download and create accounts for these apps to explore them.
- Make sure you link your comparison spreadsheet at the top of the page.

4. My App Research Summary

Tab 4: My App Research Summary – Define Your Problem + User Needs

Purpose: Now that you’ve chosen your topic, explored your user, and compared real apps, it’s time to bring everything together. This step will help you clearly explain what your app is about, who it’s for, and what it needs to include.

You’ll complete a document called a **Research Synthesis**—this is a summary of the most important ideas from your research so far.

This work will shape everything that comes next, including your core tasks, wireframes, and pitch.

What You’ll Submit

You’ll complete a **My App Research Summary Google Doc** using the template below. This will be submitted for a grade (20 points) and used to guide your app design moving forward.

Make a Copy of the Template

Click here to get your own editable copy:

Make a Copy – [My App Research Summary](#)

Once you’ve filled it out, paste your link below:

Link your document here: [LINK](#)

Don’t forget to change the sharing settings to “Anyone with the link can view.”

What’s in the Document?

You’ll complete 5 short sections:

1. **What problem are you focusing on, and why does it matter?**
2. **Who is your app for, and what do they need?**
3. **What did you learn from other apps?**
4. **What features will your app include?**
5. **How will your app help solve the problem?**

You’ll also see sentence starters and example responses to guide you.

What You Should Use:

-  Your **Pre-Work Worksheet** (posted separately in Google Classroom)
-  Your **App Comparison Sheet** (Tab 3)
-  Any notes or inspiration you've gathered along the way

This is where your research turns into a clear, focused plan.

Why This Matters

- You'll use this document as a reference for **your 3 core tasks** (coming soon)
- It will guide your **wireframes and screen sketches**
- You'll also use this thinking in your **30-second pitch** and **slide deck**

Getting this right makes the rest of the project smoother and stronger.

5. 💡 Defining Your Idea + 30-Second Pitch

Tab 5: Defining Your Idea

Independent Activity

Goal: Clearly define what your app will do and who it will help. Identify 3 core tasks your user should be able to complete.

What Are Core Tasks?

Core tasks are the **main actions your user needs to take** in your app. These are the essential features that help your app solve a problem or support your user's goals.

Familiar App Examples – What Are *Their* Core Tasks?

TikTok

- Watch short videos
- Like or comment on content
- Upload your own videos

Google Maps

- Search for places and get directions
- Switch travel modes (walk, bus, drive)
- See nearby locations (food, gas, etc.)

Duolingo

- Take short language lessons
- Track your streak
- Get reminders to study

Step 1: Brainstorm Possible Core Tasks

Think about everything your user might want to do in your app. List as many ideas as you can. These should all be **actions** a user might take.

 **Start each one with a verb (like “log,” “view,” “track,” “join,” “share,” “search,” “find,” etc.)**

Possible tasks my app might let users do:

- 1.
- 2.
- 3.
- 4.
- 5.
- 6.
- 7.
- 8.

Step 2: Choose Your Top 3 Tasks

Review your list and pick the **three most important tasks** that your app must include. These should be features that help solve the user's problem or achieve their goal.

Each of your app's core tasks should describe what the user can do and why it matters. These sentences will help you design the screens you need.

Sentence Structure (for each task):

*My app will let users **[action]** so they can **[achieve a specific result or benefit]**.*

Then describe the screen you'll design for it:

*This will happen on a screen where users can **[what the screen shows or allows]**.*

Example (Mental Health App)

Top 3 Core Tasks:

1. My app will let users **track their daily mood** so they can **recognize patterns and manage their emotions**.
This will happen on a screen where users can **choose an emoji and write a short reflection**.
2. My app will let users **read tips for stress or anxiety** so they can **get support when they need it most**.
This will happen on a screen where users can **scroll through short, calming suggestions by topic**.
3. My app will let users **save favorite tips to revisit later** so they can **build a personal mental health toolkit**.
This will happen on a screen where users can **tap a heart icon and view their saved list**.

Continue to the activity on the next page

**Core
Task #**

Fill-in-the-blank (highlighted cells)

Example		My app will let users...	add a new homework assignment	so they can...	stay organized and remember what's due.
		This will happen on a screen where users can...		enter a title, due date, and notes.	
#1		My app will let users...	[action]	so they can...	[achieve a specific result or benefit]
		This will happen on a screen where users can...		[what the screen shows or allows]	
#2		My app will let users...	[action]	so they can...	[achieve a specific result or benefit]
				[what the screen shows or allows]	
#3		My app will let users...	[action]	so they can...	[achieve a specific result or benefit]
				[what the screen shows or allows]	

6. 30-Second Pitch

Tab 6: 30-Second Pitch

Partner Activity (pair up with one other person)

Part 1: Write Your Pitch

Goal:

Create a short, clear explanation of your app idea. Your pitch should explain what the app is, who it helps, and why it matters. **Be sure to move on to Part 2 once you have filled in the table below.**

Use this sentence structure:

Hi, I'm building an app called **[App Name]**.
It helps **[who your user is]** with **[the problem or need]**.
The app includes features like **[1-2 core tasks or functions]**
so that users can **[benefit or outcome]**.
It's designed to be **[a key trait: easy to use, motivating, personalized, etc.]**.

Example Pitch - Climate Tracker

Hi, I'm building an app called **EcoLog**.
It helps **busy families** **reduce their carbon footprint in small, daily ways**.
The app includes features like **tracking your green actions and earning badges**
so that users can **feel proud of their progress and stay motivated**.
It's designed to be **simple, visual, and fun to use for all ages**.

Your Turn

Use the space below to draft your own pitch. You can use the structure above or rewrite it in your own style as long as it includes:

- App name
- The problem it solves
- Who it's for
- What it helps users do
- Why it's valuable

Hi, I'm building an app called	
It helps	
with	
The app includes features like	
so that users can	
It's designed to be	

Part 2: Peer Review + Pitch Refinement

Step 1: Swap with a Partner

Find someone else who is on this step.

Take turns reading your pitch out loud while your partner listens and asks:

- Is it clear what the app does?
- Do you understand who it's for?
- Are the features explained well?
- What's missing or could be stronger?

Step 2: Give Feedback

Use this sentence starter:

“One thing that was clear was _____. One thing you could improve is _____.”

Take notes, then revise your pitch to make it even stronger.

Revise Your Pitch (Second Draft)

Write a cleaner, more confident version of your pitch below using your partner's feedback:

Hi, I'm building an app called	
It helps	
with	
The app includes features like	
so that users can	
It's designed to be	

7. 🙌 Thinking Like a User

Tab 7: 🖐️ Thinking Like a User – Interaction Comes First

Short Reading and Mini Activity

Purpose: Before you sketch your app, think about how someone will actually use it. Good design isn't just about how your screens look—it's about how they work.

🧠 What Is Interaction Design?

Interaction design is all about how a user **moves through your app** and how each screen **responds** to their actions.

Every time you:

- Tap a button
 - Swipe a screen
 - Type into a search box
 - Scroll through a list
- ...you are **interacting** with the design.

🧩 Your Job as a Designer

When you start sketching your app, you'll need to **think like the user**:

- What's the first thing they'll see?
- What will they want to do on this screen?
- Where will they tap?
- Will they know what to do next?

📱 Example: Mood Tracking App

You want the user to log how they're feeling each day.

What should they tap first?

What happens after they choose a mood?

Is there a way to add a note or journal entry?

You might need:

- A screen with simple mood icons
- A "Next" button
- A space to type a short note
- A way to save or go back

Mini-Activity: Walk Through One Core Task

Pick **one** of your core tasks and ask yourself:

1. What screen does the user start on?
2. What action do they take?
3. What happens next?
4. How do they know they've completed the task?

This is the mindset you'll use in your first wireframe sketch!

Why Usability Matters

When you open a new app, you expect to know what to do—**without having to read instructions** or guess. That's called **usability**: how easy it is for someone to use your app the first time they try it.

If the layout is confusing or the buttons move around, people might get frustrated or stop using the app completely—even if the idea is great.

Good apps:

- Feel **clear and easy** from the very first screen
- Help you find what you need quickly
- Work the way you expect them to

Your job as a designer is to **make life easier** for your user—not harder. You can do that by keeping things consistent, clear, and predictable across all your screens.

Now let's look at a few **simple tips** to help with that.

Keep It Simple (Seriously!)

Every time a user taps, swipes, or types something in your app, that's a **step** in the process. If it takes too many steps to do something simple, people might **give up**.

 *Example: On TikTok, posting a video takes just a few taps. If it took 10 clicks to record, add music, and post, fewer people would bother—and the app wouldn't be as popular.*

That's why great apps **make the important stuff easy**. Think about how many steps your user will need to take—and ask yourself:

“Can I make this simpler?”

Your app should help guide them clearly, not make them work harder.

Tips to Keep Your App Easy to Use

When you design an app, each screen should feel like part of the same experience. If things suddenly move around or behave differently, people will get confused—and might stop using your app.

To make your app feel smooth and easy, keep things **predictable and consistent**.

Everyday Example:

Imagine if **every classroom door looked the same**, but some opened by pulling and some by pushing. You'd probably get stuck or bump into one eventually.

Good design **makes it obvious** what you're supposed to do. If a user gets confused, they might give up and stop using the app.

Tip 1: Keep Buttons and Menus in the Same Spot

- If someone sees a “Back” button or menu on one screen, they should find it in **the same place** on every screen.
-  *Example: If your Home button is at the bottom right, don't move it to the top left later. That's like putting the door handle in a different spot every time.*

Tip 2: Use a Similar Layout on Each Screen

- Keep things organized in the same way across your app.
-  *Example: If your app shows your tasks in a list on one screen, don't suddenly switch to a random grid or a bunch of buttons in weird spots on the next screen.*
 - *It's like organizing your binder—if each section is labeled and in the same place, it's way easier to find what you need.*

Tip 3: Help the User Know Where They Are

- Show people where they are using titles, icons, or tabs.
-  *Just like hallway signs at school or mall directories, your app should make it clear where the user is and how to go back.*

Tip 4: Make Interactions Work the Same Way

- If tapping a card opens a new page on one screen, it should do the same thing everywhere else.
-  *Example: If the microwave buttons in the school cafeteria did something different every time, that would be frustrating. You want the same buttons to do the same thing every time.*

Ask Yourself:

- Can someone figure out what to tap without guessing?
- Does each screen feel like it belongs in the same app?
- Does the layout help people find what they need quickly?

If the answer is yes—you're designing like a pro. 👍

8. Initial Wireframe or Sketch

Tab 8: Initial Wireframe or Sketch

Purpose:

It's time to start sketching your app! Your goal is to **show what your screens will look like** and how a user will move through each one. This is called a **wireframe**—a simple drawing of your app's layout and buttons. You don't need color or decoration yet. Just focus on:

- Where things go on the screen
- What the user taps
- How they move from screen to screen

Step 1: Walk Through Your 3 Core Tasks

You already wrote your core tasks. Now you'll **draw a screen-by-screen path** for each one. For each task:

1. What screen does the user start on?
2. What do they tap or do next?
3. What happens when they complete the task?
4. How do they know it worked?

Step 2: Sketch It Out

Use **paper and pencil** to draw your wireframes. Start with **one task at a time**.

- **Draw 2–5 screens** per task (whatever it takes to show the steps clearly)
- **Use arrows** to show where each screen leads
- **Label buttons and screens** so we can follow your thinking
- If you want your screens to look neat, you can grab a **ruler** from Mr. Fox!
- If you want to draw directly onto sheets with screen outlines, come see Mr. Fox.

 You should complete this process for **all 3 of your core tasks**.

Helpful Reminders:

- Each set of wireframes should match one of your top 3 user tasks
- Keep your layout consistent between screens
- Think about what your user will expect to tap next
- Ask: “Would this screen make sense to someone seeing it for the first time?”

Need Help Getting Started?

Try these wireframe elements:

- Rectangle = screen
- Boxes = buttons
- Lines = arrows to the next screen
- Circles = icons
- Labels = words or text the user sees

If you're stuck, ask a classmate or re-read the examples in Tab 7!

Once you are finished, upload clear pictures of your wireframes into Google Classroom. You should put them all in a Google Drive folder then add the link to the Drive folder in Google Classroom. Make sure to share.

Examples of simple wireframes ☐

9. Peer Feedback + Iteration

Tab 9: Peer Feedback + Iteration

Purpose:

Now that you've sketched your app, it's time to **test it out with a classmate**, just like a real UX designer would. You'll see what's working, what's confusing, and where you can improve.

Step 1: Peer Walkthrough Activity

Pair up with a partner. You'll each take turns being the **designer** and the **tester**.

As the **designer**, choose one of your core tasks and say:

"Here's what my user needs to do. Can you walk through the steps with me?"

Lay out your sketches so your partner can "tap" through the app using their finger. Let them explore without giving too many hints—just observe! You want to see if they can complete the task without you telling them what to do.

Questions for the Tester to Think About:

- Could you tell what to do on each screen?
- Did the flow make sense from one screen to the next?
- Was anything missing or confusing?
- Did the task take too many steps?
- What did you like about how it worked?

Step 2: Record the Feedback You Got

What did your partner say was working well?

What was unclear or could be improved?

Sentence Starters for Giving Feedback

Use these to give helpful, kind suggestions:

- "It was really clear when you _____, but I was a little unsure about _____."
- "I liked how you showed _____. One thing you could add is _____."
- "If I were using this app for real, I might expect to see _____."

Step 3: Make Revisions

Now take what you learned and **improve your design**:

- Did you forget a step in your task flow?
- Did something feel out of order or too complicated?
- Could you combine screens or simplify the layout?

You can sketch updated versions, add notes, or label what you changed.

Answer the following questions:

What did you change about your original wireframes after receiving feedback?

What part of your app feels stronger now after making changes?

Why do you think it's important to take time to revise and improve your work—especially after getting feedback?

Can you think of another class or project where revising like this could help you do better work?

10. From Sketch to Prototype

Tab 10: From Sketch to Prototype

Short Reading + Reflection

How small changes lead to big impact in real-world design

When designers create apps, websites, or digital tools in the real world, they never start with something perfect. They start **simple**—usually with hand-drawn sketches or rough wireframes, just like you did.

This is called a **low-fidelity wireframe**. It shows where things go and how the app works, but it's not fancy yet. It doesn't have final colors, icons, or full text. That's okay! At this stage, the most important thing is **the idea** and **the experience**—what users can do and how easily they can do it.

Why Do We Start Simple?

If you spend hours polishing a screen before testing it, you might waste time designing something that doesn't actually work well. Starting rough lets you **change things quickly**—and that's key.

Designers share their rough drafts to:

- Get feedback before spending time on final details
- Catch problems early
- Build confidence in what works

This process is called **iteration**—it means **you test, improve, and repeat**.

Why It's Good to Share Before It's Polished

When your design looks “finished,” people might not want to hurt your feelings—so they'll just say:

“It looks great!” or “Nice job!”

Even if something's confusing, they may **not be honest**, because it feels like your work is “done.”

That's why designers often **share messy drafts first**. In a book called *The Mom Test*, this idea is explained like this:

“If you show your mom something shiny and perfect, she'll say she loves it, even if it doesn't make sense.”

Sharing early means you're more likely to get **real feedback**—and that makes your app stronger.

What Happens Next?

As you improve your wireframes based on feedback, you can start to make them more detailed. This is called **increasing fidelity**. You might:

- Add icons or simple images
- Use real button shapes
- Write more realistic labels or instructions
- Start thinking about spacing and layout

Eventually, your idea can turn into a **prototype**—something that looks and feels like a real app, even if it doesn't fully work yet.

In the Real World

Companies like Apple, Instagram, and Duolingo **use the same process** you're using right now. Their designers:

1. Sketch and wireframe
2. Get feedback
3. Revise over and over
4. Build a testable prototype
5. Launch the final version

Even after launch, apps are updated constantly based on user feedback—**iteration never stops**.

Respond to the following questions:

1. How did showing an unfinished version of your app help you improve your idea?

2. Why do you think people give more helpful feedback when your design is still rough?

11. Final Wireframe + Slide Deck Prep

Tab 11: Final Wireframes + Slide Deck Prep

Purpose: Use feedback from your sketches to create **digital wireframes** that show what your app will look like and how it works. These wireframes will go into your final slide deck for your presentation.

Slide Deck Template: [LINK](#)

What Are Final Wireframes?

Final wireframes are **digital layouts of your app screens**. They're still simple—but they're cleaner, clearer, and easier to read than hand-drawn sketches.

They should:

- Show your **final decisions** after testing and feedback
- Make it easy for others to understand how your app works
- Focus on layout, structure, and usability—not full color or decoration

Important: These Must Be Digital

You must create your final wireframes using a digital tool.

Paper sketches will not be accepted for this step.

Tools You Can Use (No Login Required)

Choose either of these tools to build your wireframes:

- [Wireframe.cc](#) – clean and minimal
- [Excalidraw](#) – sketchy and flexible

Pick the one that feels most comfortable to you!

What to Include

You should design **3 to 5 digital screens** that show:

- A **main/home screen**
- Screens to show your **most important core task being completed**
 - You should include show the progression of tasks, including showing where the user would tap/swipe to complete these tasks. You will show your progress
- A screen showing a **completed action** or success message
- **Optional:** a settings screen, tip screen, or anything that supports your idea

🌟 **Need inspiration?** Check out the examples of digital wireframes at the end of this document.

🧠 Check Yourself:

- Can someone who's never seen your app **figure out how it works?**
- Are all important buttons and labels easy to find?
- Do the screens follow the **tips you learned** in Tab 7?

12. 🧠 Final Reflection

Tab 12: Final Reflection – What I Learned

Purpose:

You've just gone through a full design cycle—from brainstorming and research to testing and refining your own app idea. That's a huge accomplishment! Now it's time to pause, reflect, and think about **what you learned**, **what you're proud of**, and what you'd do next time.

Reflection helps you take what you learned here and apply it to future projects—not just in design, but in school, work, and life.

What You'll Do:

You'll answer a few reflection questions to think about:

- What you learned about **design thinking and UX**
- What you improved through **feedback and iteration**
- What you'd do differently **next time**
- How this process connects to other classes or real-world work

Reflection Questions (Answer in short paragraphs or bullet points)

1. **What's one big thing you learned about design thinking or user experience?**

2. **What part of your app changed the most after you got feedback? Why did you change it, and how did it make your app stronger?**

3. **What part of your project are you most proud of and why?**

Continued on next page

4. **If you had more time, what's one thing you would add or improve?**

5. **How could you use this process of testing, improving, and repeating in other classes or projects?** (*Think about writing, science labs, building something in art or robotics...*)
