Unit 2 Project Grading Scale

Substitute teacher reference

Use the posted Unit 2 project checklist and rubric to judge the work. Completing every required element well earns 100%. The 103% and 106% tiers recognize meaningful work beyond those requirements.

Tier	Grade	Out of 20	Evidence to look for
Below Starter	Varies	Varies	Major requirements are missing, the program does not meaningfully perform the task, or evidence is insufficient. Score the demonstrated work using the posted rubric. There is no automatic 80% minimum.
Starter	80%	16/20	A meaningful, working baseline, with gaps in required concepts, completeness, or code quality.
Skilled	100%	20/20	Every required element is complete and correct. Code is readable, and the student demonstrates the intended concepts.
Legendary	103%	20.6/20	Meets Skilled expectations plus one meaningful extension, such as an extra feature, a harder variation, or substantial polish beyond the requirements.
Mythic	106%	21.2/20	Meets Skilled expectations plus substantial extensions showing exceptional depth, creativity, or ambition. This is a larger reach than one add-on.

How to apply the scale

- Check the required work first. An optional feature does not make up for missing baseline requirements.
- Select one overall tier based on the project rubric. Above 100%, the scale increases by 3 percentage points per tier: Skilled 100%, Legendary 103%, Mythic 106%.
- Use the assignment's posted point maximum. The repo's 20-point project maximum remains provisional; the points above illustrate that maximum.

Source and version note

FoxCS repo: 02-authoring-system/grade-point-scale.md, revised September 11, 2026; project-rubric-and-xp-tiers.md for tier descriptions. The older 104% cap in the rubric document's opening note is superseded by the 106% scale. Avoid stacking the older separate bonus mechanism on top of these tier scores.

Character Status Tracker Rubric

Use this page when the assignment title is 02.1 Character Status Tracker. The required evidence and original credit categories below come from the repo rubric. Its current live Moodle posting has not been verified.

Required evidence from the authored rubric

Criterion	Full evidence	Partial evidence
Variables and names	At least four meaningful character-state variables with valid snake_case names.	Some meaningful variables or names are present, but the count or naming requirements are incomplete.
Value types	At least one quoted string and one numeric value.	Only one required type is demonstrated.
Labelled output	Every variable is printed with a clear text label.	Some variables are omitted or printed without a label.
Reassignment	An existing variable receives a new value and is printed again afterward.	An update is attempted, but a different name is created or the updated value is not displayed.
Execution and submission	Program runs without syntax errors; submitted as one .py file.	Relevant work is present with a repairable defect or an incorrect submission format.

Original source credit categories

Full credit: all required items are met, the code runs, and reassignment is visible. Partial credit: required items are mostly present with a missing or broken element. The source flags fewer than four real variables, no labels anywhere, or a file that does not run at all as no credit or insufficient evidence. Preserve an actually posted rubric; refer uncertain cases to the teacher.

Proposed mapping to the current project scale

Tier	Concrete evidence
Skilled 100%	All required evidence above is met. Optional additions are not needed for full credit.
Starter 80%	Meaningful baseline evidence with a remaining gap; record the exact missing criterion. Do not use this tier to override a posted insufficient-evidence rule.
Legendary 103%	Skilled plus at least two additional, distinct state variables and a specific comment explaining a naming choice.
Mythic 106%	Legendary plus a second variable reassigned at a separate event and a genuine two- or three-sentence comment explaining how this program's labels help a player.

The extension requirements are source-derived; their mapping to 103% and 106% is proposed. The older task uses stacking XP labels. Apply one current tier, without adding those old XP bonuses again.

Personal Profile Generator Rubric

Proposed rubric for the unit-level project. The repo names this project but contains no authored project rubric. Use this page with the proposed task in the Units 1–4 Teacher Assessment Handbook, after confirming these requirements match what students were assigned.

Required task for full credit

Create a fictional profile using at least five meaningful variables, including str, int, float, and bool. Print a labelled profile, reassign one existing variable and show the update, and write a summary using + with str() where needed. Submit a runnable .py file with a comment explaining a data-type choice and evidence from two test runs. Use fixed values; user input is not required.

Evidence rubric

Criterion	Full credit evidence	Partial credit evidence
Correctness	The program runs. Labels and summary match the current values, including the reassigned value. Both tests behave as expected.	Much of the output is correct, but one value is stale, a local defect remains, or one test fails.
Concept usage	Five meaningful variables include all four types. Same-name reassignment and the required + and str() conversion are correct.	Some types or conversion are missing, or an attempted update creates a second name. Credit each concept actually demonstrated.
Code quality and explanation	Names are meaningful; labels are clear; a specific comment explains why one chosen type fits its value.	Code is readable in places, but names or labels are unclear, or the explanation is generic or incomplete.
Completeness and testing	Profile, update, summary, .py submission, and two documented tests are present.	A required section, submission detail, or test is missing.

Overall tier decisions

Tier	Evidence needed
Below Starter	Central profile or state-change evidence is missing, nonfunctional, or too limited. Determine credit from the posted rubric and teacher review; no automatic 80% floor.
Starter 80%	A runnable, meaningful profile with at least four variables, a string and a number, labels, and visible same-name reassignment, but one or more full-credit elements missing.
Skilled 100%	Every required element above is complete and correct. No optional feature is required.
Legendary 103%	Skilled plus a useful additional profile detail and a documented changed-data test that confirms the profile and summary still agree. The extension must add something beyond the required tests.
Mythic 106%	Legendary plus a clear design rationale explaining type choices, variable updates, and output usability with concrete examples from the program. Show substantial added depth, not extra lines alone.

Test and feedback examples

Test 1: Nova starts at level 3, is reassigned to 4, and the updated label and summary both show 4. Test 2: change the starting level to 7 and the reassigned value to 8; both displays must show 8. Other coherent profile values are valid.

Partial-credit feedback: “Your profile runs and shows the update. To reach Skilled, add a float and a Boolean, explain one type choice, and document the second test.”
